What is a supercapacitor?

A supercapacitor is a specially designed capacitor which has a very large capacitance. Supercapacitors combine the properties of capacitors and batteries into one device. Supercapacitors have charge and discharge times comparable to those of ordinary capacitors.

What is a super capacitor?

Supercapacitors occupy the gap between high power/low energy electrolytic capacitors and low power/high energy rechargeable batteries. The energy W_{max} (expressed in Joule) that can be stored in a capacitor is given by the formula This formula describes the amount of energy stored and is often used to describe new research successes.

What is the maximum capacitance a supercapacitor can provide?

The maximum capacitance that these capacitors can provide is 1 Farad. If the higher capacitance is required, the capacitors will need to be quite large, which may or may not fit into typical electronic circuits. Enter the supercapacitor.

What does L1 & L2 mean in a supercapacitor?

L1= Load life rating of the super capacitor (typically 1000 hours at rated temperature). L2= expected life at operating condition. T_m = Maximum temperature rating of the supercapacitor. T_a = Ambient temperature the supercapacitor is going to be exposed to in the application. V_r = rated voltage of capacitor.

This design gave a capacitor with a capacitance on the order of one farad, significantly higher than electrolytic capacitors of the same dimensions. This basic mechanical design remains the ...
