A fuel cell is an electrochemical cell that converts the chemical energy of a fuel (often hydrogen) and an oxidizing agent (often oxygen) [1] into electricity through a pair of redox reactions. [2]

A fuel cell is an electrochemical device that converts chemical energy from a fuel (typically hydrogen) and an oxidizing agent (such as oxygen) directly into electrical energy, ...

Fuel cells can be seen as an energy storage device, as energy can be input to create hydrogen and oxygen, which can remain in the cell until its use is needed at a later time. In this sense ...

Fuel cell systems are similar to other systems for energy storage or generating devices, such as batteries and photovoltaic (PV) cells, in the sense that they can generally be described as a ...

It is an electrochemical device that converts chemical energy into electrical energy by combining a fuel (usually hydrogen) with an oxidant (typically oxygen from the air). Unlike ...

Fuel cell, any of a class of devices that convert the chemical energy of a fuel directly into electricity by electrochemical reactions. A fuel cell resembles a battery in many ...

Fuel cells are electrochemical devices that convert chemical energy into electrical energy through a controlled redox reaction. They are distinct from batteries in that they require ...

Fuel cells are electrochemical devices that use a fuel and an oxidizing agent to convert chemical energy into electricity through redox reactions.

Fuel cells can be used in a wide range of applications, providing power for applications across multiple
