What is EMS communication?

EMS communication refers to the exchange of data and instructions between the Energy Management System and various components within a BESS container. The EMS serves as the central intelligence hub, orchestrating the operation of batteries, inverters, monitoring devices, and other subsystems to achieve optimal performance objectives.

What is EMS & how does it work?

The objective of the EMS is to shift and shave the electricity usage of consumers by charging and discharging the ESS to minimize their bills . The savings often come from demand charge reduction, time-of-use (TOU) energy charge reduction, and utilization of net-metering energy.

Why do EMS need a thermal model of batteries?

Batteries can reach a high temperature limit long before they reach a low voltage limit on discharge, meaning that the EMS needs a thermal model of the batteries to correctly predict battery operational limitations. 1.2.3.

How to coordinate operations between different subsystems of an ESS?

After the operating mode is specified by the secondary control, control references are calculated and passed to the primary controller. 3. Communication Interface To coordinate operations between different subsystems of an ESS, each subsystem must be equipped with a communication interface.
